

Discussion & conclusion

Limitations

- Insignificant surprisal effects in FR-MRI, which could be due to the nature of the corpus.
- FR-MRI used less natural sentences as the stimuli → may explain why surprisal effects were insignificant.

Dataset

USC

Methods

Audio segmentation

- AE-MRI, AE-EMA & FR-MRI came w/ manual word-level & phoneme-level segmentation.
- BE-US was segmented through Montreal Forced Aligner (McAuliffe et al. 2017).
- The phonetic transcriptions were then mapped back to the underlying phonemic transcriptions based on *espeak* & *eng_to_ipa*.
