

# Research questions

- Does a target phone's distinctiveness as a function of the preceding context phone positively correlate with the bigram's surprisal, given its context within a word?
- If so, would flexibility allow for an enhanced positive surprisal effect in the acoustic domain while leading to a reduced positive effect/a negative effect of surprisal in the articulatory domain?

# Methods

## Preview

1. Data: acoustic/articulatory data from published datasets
2. Distinctiveness measurement in acoustics & articulation
3. Bigram surprisal calculation
4. Phoneme flexibility: degree of freedom between articulatory synergies & the speech target
