

Interim summary

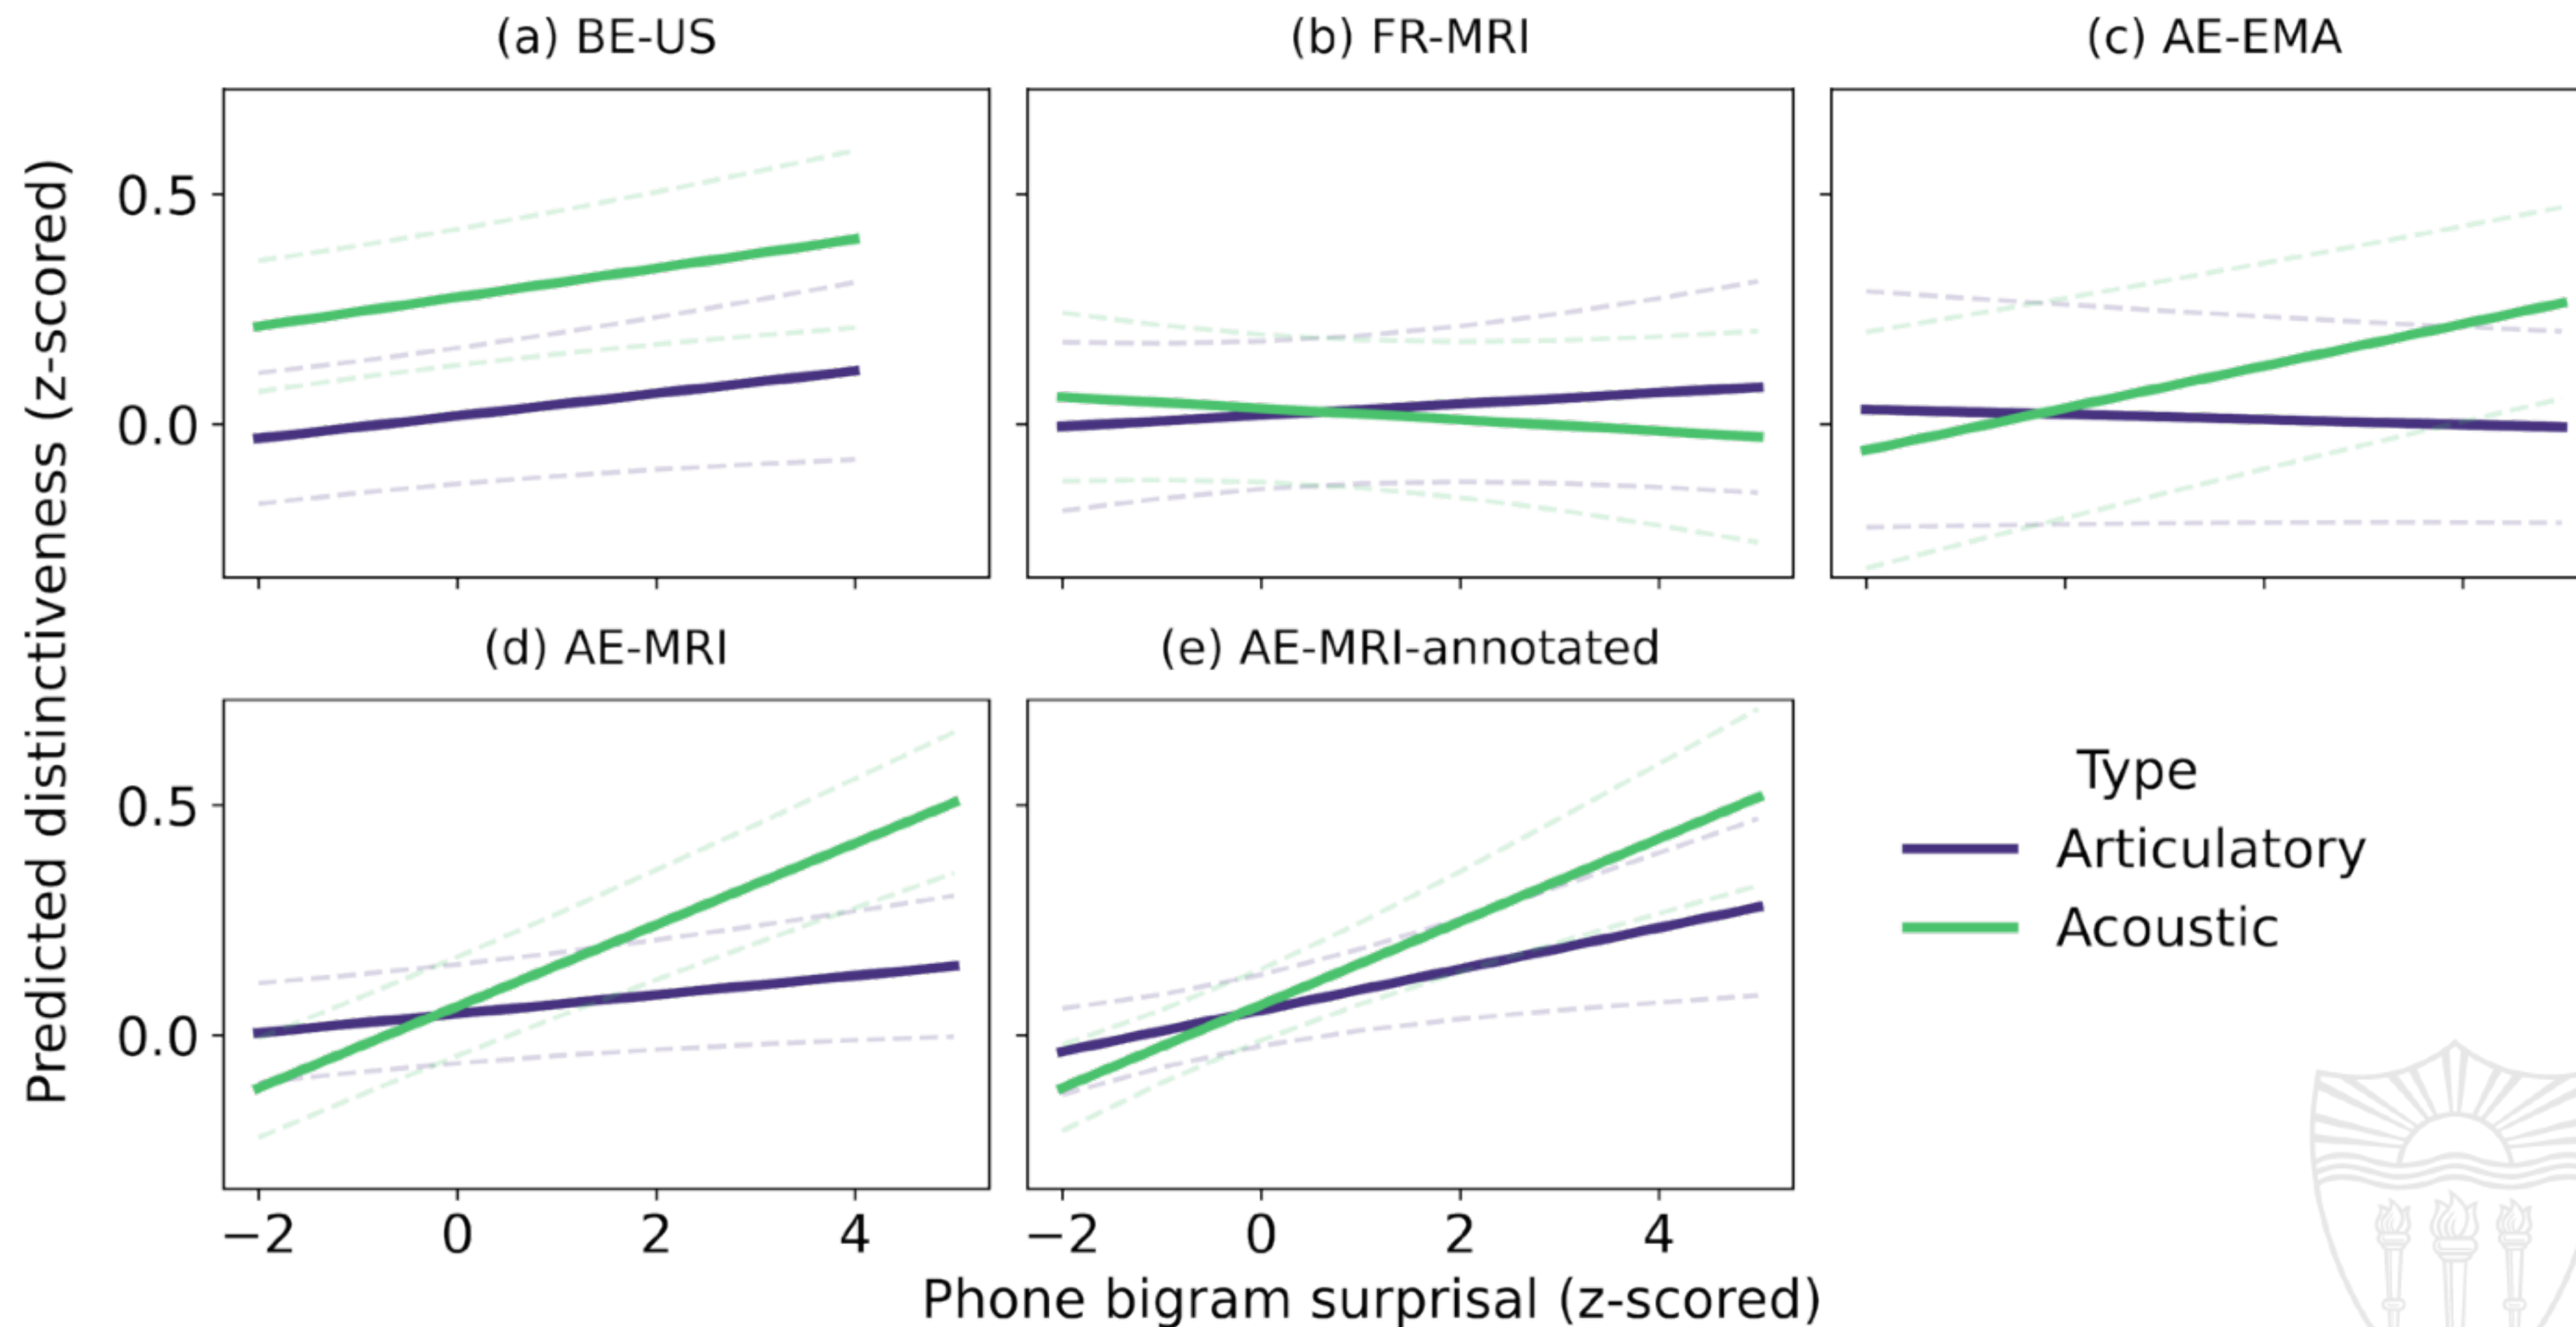

Questions probed in this study

- Do we see surprisal effects overall across acoustics & articulation?
- Does speech flexibility (i.e., degree of freedom between articulatory synergies & speech target) enhance surprisal effects in acoustics & decrease surprisal effects in articulation?

Results

Surprisal effects on distinctiveness

- **Positive** surprisal effects except for FR-MRI
- **Weaker** effects in articulation:
 - Insignificant in BE-US & AE-EMA
 - Significant in AE-MRI & AE-MRI-annotated
