

Perceptual recoverability, articulatory efficiency & speech flexibility

- Speech flexibility (i.e., motor equivalence; cf. Perrier & Fuchs 2015) suggests that the same target can be achieved through an array of motor movements.
- Certain degrees of freedom exist, allowing for an intended speech target to be achieved via an array of articulatory synergies.
- The speaker could thus have available a variety of more contextually compatible articulatory synergies that allow for the attainment of desired perceptual recoverability.

Perceptual recoverability, articulatory efficiency & speech flexibility

- Consequently, such flexibility may be a window for the speaker to react differently in the face of variable information-theoretic constraints in the articulatory & acoustic domains.
