

Perceptual recoverability, articulatory efficiency & speech flexibility

- Speech production is often regarded as conditioned by:
 - Perceptual recoverability pressures
 - Articulatory efficiency pressures (Jun, 1995; Kirchner, 2001; Flemming, 2004; Cohen Priva, 2017)
- Speech production regarded as mediated by the two competing forces.

Perceptual recoverability, articulatory efficiency & speech flexibility

- Speech flexibility (i.e., motor equivalence; cf. Perrier & Fuchs 2015) suggests that the same target can be achieved through an array of motor movements.
- Certain degrees of freedom exist, allowing for an intended speech target to be achieved via an array of articulatory synergies.
- The speaker could thus have available a variety of more contextually compatible articulatory synergies that allow for the attainment of desired perceptual recoverability.
