

Discussion & conclusion

Information-theoretic constraints on general bigram distinctiveness

- Generalizable information-theoretic conditioning on variation:
 - When a bigram is more informative given the preceding context, the target phone2 maintains **higher distinctiveness/is more resilient to variation**.
 - Such effects are weaker in articulation (for the AE datasets).

Discussion & conclusion

The role of flexibility

- Flexibility allows for more contextually similar articulatory synergies & acoustically more distinctive speech targets at the same time.
 - Satisfies both **articulatory efficiency** & **perceptual recoverability**.
